

Name: Flores, Joshua Mico A.	Date Performed: 08/29/23
Course/Section: CPE31S4	Date Submitted: 09/04/23
Instructor: Dr. Jonathan V. Taylar	Semester and SY: 1st semester - 2023-2024
Activity 3: Install SSH server on CentOS or RHEL 8	
1. Objectives: 1.1 Install Community Enterprise OS or Red Hat Linux OS 1.2 Configure remote SSH connection from remote computer to CentOS/RHEL-8	
2. Discussion: CentOS vs. Debian: Overview CentOS and Debian are Linux distributions that spawn from opposite ends of the candle. CentOS is a free downstream rebuild of the commercial Red Hat Enterprise Linux distribution where, in contrast, Debian is the free upstream distribution that is the base for other distributions, including the Ubuntu Linux distribution. As with many Linux distributions, CentOS and Debian are generally more alike than different; it isn't until we dig a little deeper that we find where they branch. CentOS vs. Debian: Architecture The available supported architectures can be the determining factor as to whether a distro is a viable option or not. Debian and CentOS are both very popular for x86_64/AMD64, but what other archs are supported by each? Both Debian and CentOS support AArch64/ARM64, armhf/armhfp , i386 , ppc64el/ppc64le. (Note: armhf/armhfp and i386 are supported in CentOS 7 only.) CentOS 7 additionally supports POWER9 while Debian and CentOS 8 do not. CentOS 7 focuses on the x86_64/AMD64 architecture with the other archs released through the AltArch SIG (Alternate Architecture Special Interest Group) with CentOS 8 supporting x86_64/AMD64, AArch64 and ppc64le equally. Debian supports MIPSel, MIPS64el and s390x while CentOS does not. Much like CentOS 8, Debian does not favor one arch over another —all supported architectures are supported equally. CentOS vs. Debian: Package Management Most Linux distributions have some form of package manager nowadays, with some more complex and feature-rich than others. CentOS uses the RPM package format and YUM/DNF as the package manager.	

Debian uses the DEB package format and dpkg/APT as the package manager.

Both offer full-feature package management with network-based repository support, dependency checking and resolution, etc.. If you're familiar with one but not the other, you may have a little trouble switching over, but they're not overwhelmingly different. They both have similar features, just available through a different interface.

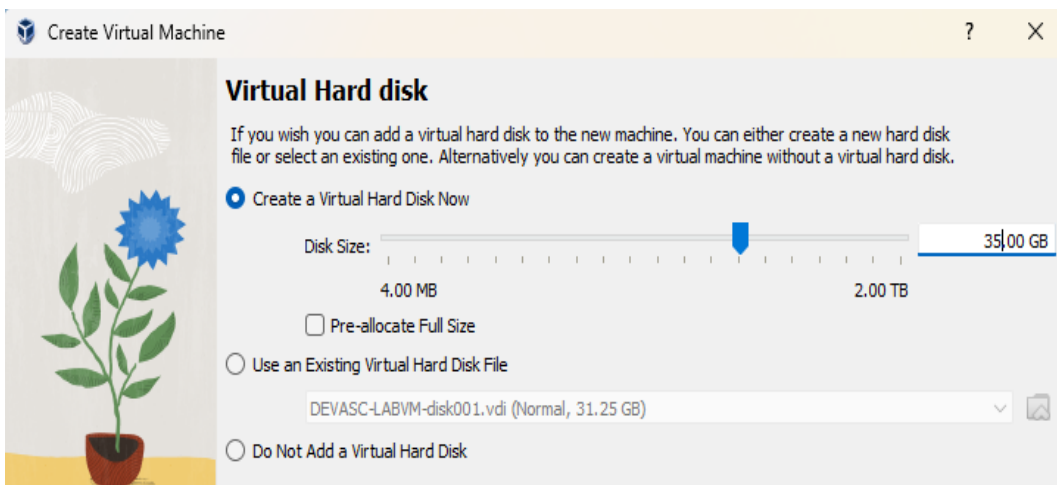

Task 1: Download the CentOS or RHEL-8 image (Create screenshots of the following)

1. Download the image of the CentOS here:

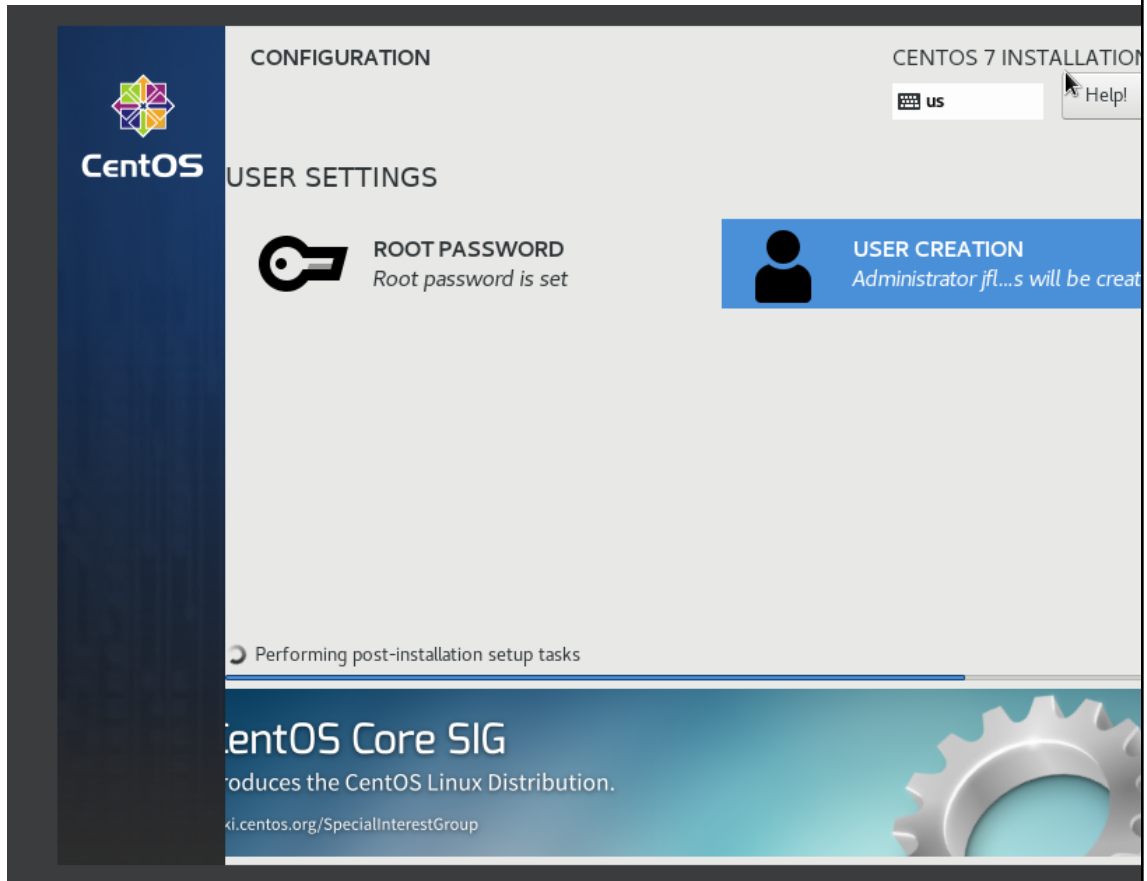

http://mirror.rise.ph/centos/7.9.2009/isos/x86_64/

2. Create a VM machine with 2 Gb RAM and 20 Gb HD.

3. Install the downloaded image.

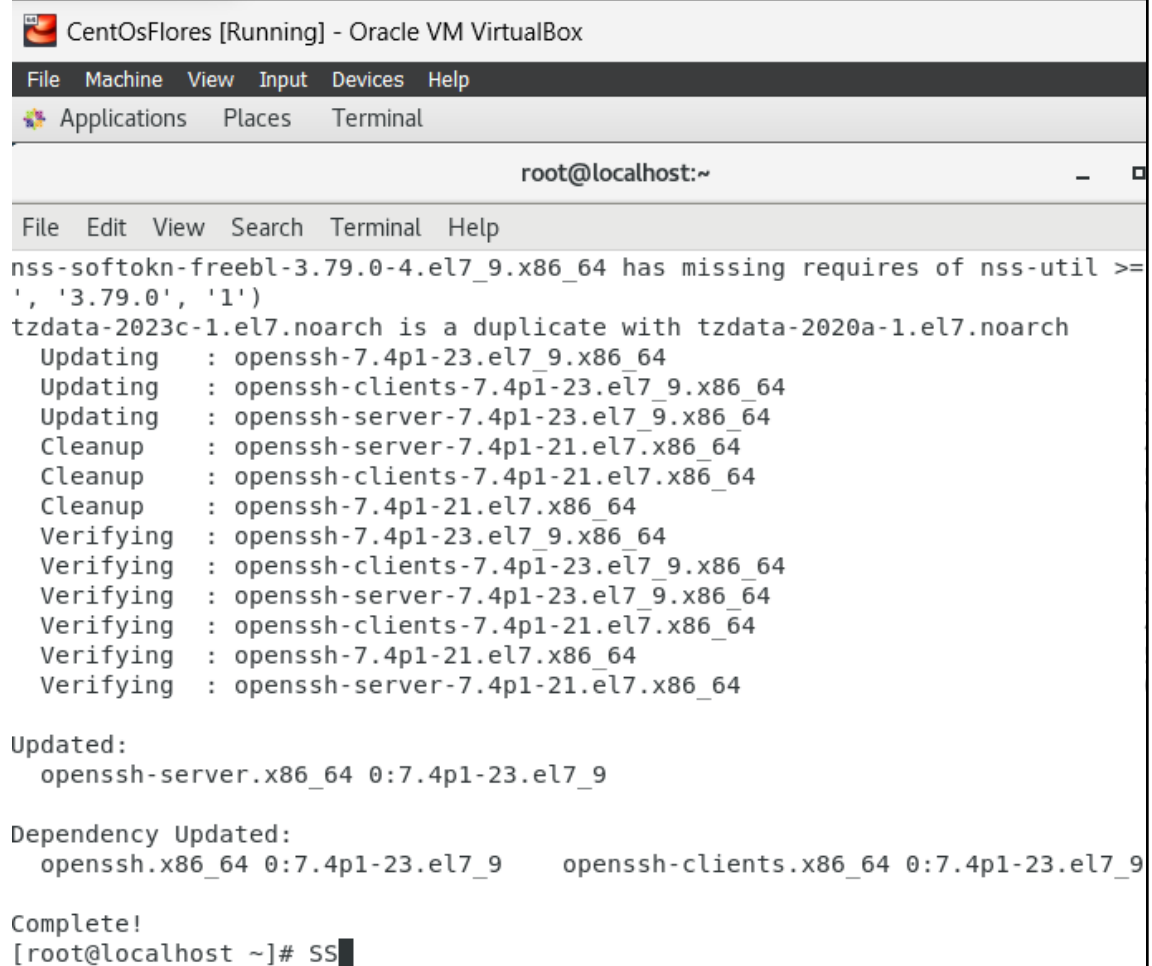

4. Show evidence that the OS was installed already.

Task 2: Install the SSH server package *openssh*

1. Install the ssh server package *openssh* by using the *dnf* command:

\$ dnf install openssh-server

```

Dependency Updated:
  openssh.x86_64 0:7.4p1-23.el7_9    openssh-clients.x86_64 0:7.4p1-23.el7_9

Complete!
[root@localhost ~]# ss
```

2. Start the *sshd* daemon and set to start after reboot:

\$ systemctl start sshd

\$ systemctl enable sshd

```
micoflores@localhost:~
File Edit View Search Terminal Help
[micoflores@localhost ~]$ systemctl start sshd
[micoflores@localhost ~]$ system enable sshd
bash: system: command not found...
[micoflores@localhost ~]$ systemctl enable sshd
```

3. Confirm that the sshd daemon is up and running:

\$ systemctl status sshd

```
micoflores@localhost:~  
File Edit View Search Terminal Help  
[micoflores@localhost ~]$ systemctl start sshd  
[micoflores@localhost ~]$ system enable sshd  
bash: system: command not found...  
[micoflores@localhost ~]$ systemctl enable sshd  
[micoflores@localhost ~]$ systemctl status sshd  
● sshd.service - OpenSSH server daemon  
   Loaded: loaded (/usr/lib/systemd/system/ssh.service; enabled; vendor preset: enabled)  
   Active: active (running) since Sun 2023-09-03 21:27:16 EDT; 3min 52s ago  
     Docs: man:sshd(8)  
           man:sshd_config(5)  
  Main PID: 3714 (sshd)  
    CGroup: /system.slice/ssh.service  
            └─3714 /usr/sbin/sshd -D  
  
Sep 03 21:27:16 localhost.localdomain sshd[3714]: Server listening on 0.0.0.0...  
Sep 03 21:27:16 localhost.localdomain systemd[1]: Stopped OpenSSH server daemon.  
Sep 03 21:27:16 localhost.localdomain sshd[3714]: Server listening on :: port...  
Sep 03 21:27:16 localhost.localdomain systemd[1]: Starting OpenSSH server dae...  
Sep 03 21:27:16 localhost.localdomain systemd[1]: Started OpenSSH server daemon.  
Hint: Some lines were ellipsized, use -l to show in full.  
[micoflores@localhost ~]$
```

4. Open the SSH port 22 to allow incoming traffic:

```
$ firewall-cmd --zone=public --permanent --add-service=ssh
```

```
[micoflores@localhost ~]$ firewall-cmd --zone=public --permanent --add-service=ssh  
Warning: ALREADY_ENABLED: ssh  
success  
[micoflores@localhost ~]$
```

```
$ firewall-cmd --reload
```

```
[micoflores@localhost ~]$ firewall-cmd --reload  
success
```

5. Locate the ssh server man config file */etc/ssh/sshd_config* and perform custom configuration. Every time you make any change to the */etc/ssh/sshd-config* configuration file reload the *sshd* service to apply changes:

```
$ systemctl reload sshd
```

```
micorlores@localhost:~  
File Edit View Search Terminal Help  
GNU nano 2.3.1 File: /etc/ssh/sshd_config  
## $OpenBSD: sshd_config,v 1.100 2016/08/15 12:32:04 naddy Exp $  
# This is the sshd server system-wide configuration file. See  
# sshd_config(5) for more information.  
# This sshd was compiled with PATH=/usr/local/bin:/usr/bin  
# The strategy used for options in the default sshd_config shipped with  
# OpenSSH is to specify options with their default value where  
# possible, but leave them commented. Uncommented options override the  
# default value.  
# If you want to change the port on a SELinux system, you have to tell  
# SELinux about this change.  
# semanage port -a -t ssh_port_t -p tcp #PORTNUMBER  
#  
#Port 22  
#AddressFamily any  
#ListenAddress 0.0.0.0

```

Task 3: Copy the Public Key to CentOS

1. Make sure that **ssh** is installed on the local machine.

```
vboxuser@manageNode: ~  
File Edit View Search Terminal Help  
vboxuser@manageNode:~$ ssh -V  
OpenSSH_7.6p1 Ubuntu-4ubuntu0.7, OpenSSL 1.0.2n 7 Dec 2017
```

2. Using the command `ssh-copy-id`, connect your local machine to CentOS.

```
[1] 11:50:11 PM 192.168.56.109
micoflores@workstation:~$ ssh-copy-id -i ~/.ssh/id_rsa micoflores@192.168.56.109
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/micoflores/
.ssh/id_rsa.pub"
The authenticity of host '192.168.56.109 (192.168.56.109)' can't be established.
ED25519 key fingerprint is SHA256:/LajSuBwx0a7nISRW5npc09i8vH1xH+6q1H/Mx8gS9E.
This key is not known by any other names
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter
out any that are already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompt
ed now it is to install the new keys
micoflores@192.168.56.109's password:

Number of key(s) added: 1

Now try logging into the machine, with:  "ssh 'micoflores@192.168.56.109'"
and check to make sure that only the key(s) you wanted were added.
```

3. On CentOS, verify that you have the `authorized_keys`.

```
[micoflores@localhost ~]$ cat ~/.ssh/authorized_keys
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQACz1BEqbxHuN+UYe+gClhVSG6X2ytWPBCBNxen

rQ== micoflores@workstation
```

Task 4: Verify ssh remote connection

1. Using your local machine, connect to CentOS using ssh.

```
micoflores@workstation:~$ ssh micoflores@192.168.56.109
Last login: Sun Sep  3 22:47:42 2023
[micoflores@localhost ~]$
```

2. Show evidence that you are connected.

```
[micoflores@workstation:~]$ ssh micoflores@192.168.56.109
Last login: Sun Sep  3 22:47:42 2023
[micoflores@localhost ~]$ ifconfig

        loop txqueuelen 1000  (Local Loopback)
```

Reflections:

Answer the following:

1. What do you think we should look for in choosing the best distribution between Debian and Red Hat Linux distributions?
 - Red Hat is more suitable for enterprise use because it has excellent enterprise support and robust security which ensures data and application security to the highest degree. Debian is more suitable for personal use because it prioritizes user autonomy, open-source software, and personalization.
2. What are the main differences between Debian and Red Hat Linux distributions?
 - Red Hat is considered more stable due to its excellent enterprise support and robust security which ensures data and application security to the highest degree. Debian is also stable and well-tested.

Conclusions

- In this activity, I learned how to install the CentOS 7 operating system. I observed that it shares similar command syntax with Ubuntu Linux, which is advantageous for me as I possess sufficient expertise to perform manipulations and modifications in the Linux environment. Additionally, I successfully established an SSH connection from my Ubuntu Linux system to CentOS by transferring the public key from Ubuntu to CentOS.
